

Program: Dhline 1.3
By: Andrea Andreetti
Date: January 2009

What is Dhline ? (Dynamic Hidden Line)

Dhline allows you to Draw Hidden line when crossing other lines in dynamic mode.

How does it work ?

-Load the Dhline.lsp file with the autoCAD "_appload" command.
-Run Dhline

Dhline will ask you to start drawing line (must start drawing continuous linetype) .

When continuing to draw continuous line and crossing another line, linetype will change and become a hidden (ISO03W100) linetype. The ISO03W100 linetype will auto load and become available for dhline. For each crossing line having same layer on the current you are creating....DHline will switch from continuous to ISO3w100 continually.

If linetype does not appear as hidden, readjust ltscale AutoCAD variable or, be sure that your linetype are available.

Holding down the shift key and moving the mouse will switch the linetype process.

Use mouse left-click to change line direction.

Use mouse right-click to accept the modifications

Each modification be showed on real time.

Enjoy !
